Optimal Transport

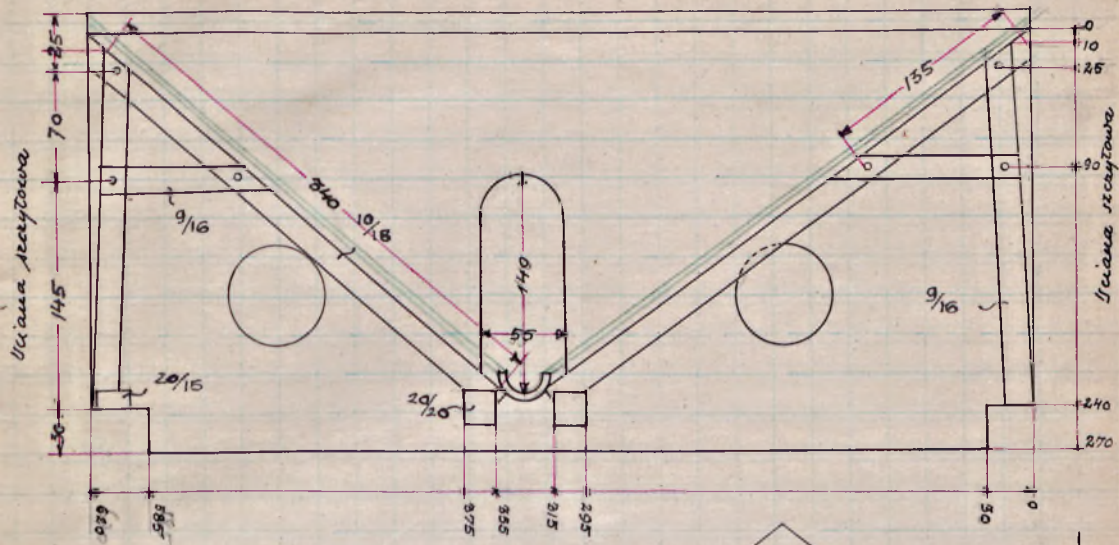

The optimal transport problem is to find a mapping T from a probability measure μ on X to a probability measure ν on Y such that $T_{\#}\mu = \nu$ and the cost $\int c(x, T(x)) d\mu(x)$ is minimized. The cost function $c(x, y)$ is assumed to be non-negative and lower semi-continuous. The set of all such mappings is denoted by $\Pi(\mu, \nu)$. The optimal transport cost is denoted by $T(\mu, \nu)$.

Plan of Building
The following is a plan of a building...

The building is a two-story structure with a gabled roof. It is situated on a rectangular plot of land. The plan shows the layout of the rooms, including a large central hall, several smaller rooms, and a kitchen. The building is oriented with the gable end facing north. The surrounding area is marked with a grid, indicating the location of the building on the plot.

Chemical Equilibrium

Consider the reaction: $2SO_2(g) + O_2(g) \rightleftharpoons 2SO_3(g)$
Initial concentration of SO_2 is 2.0 mol/L and that of O_2 is 1.0 mol/L .
At equilibrium, the concentration of SO_3 is 1.6 mol/L .
Calculate the equilibrium constant K_c for the reaction.
